

Heat Soak Test Ovens

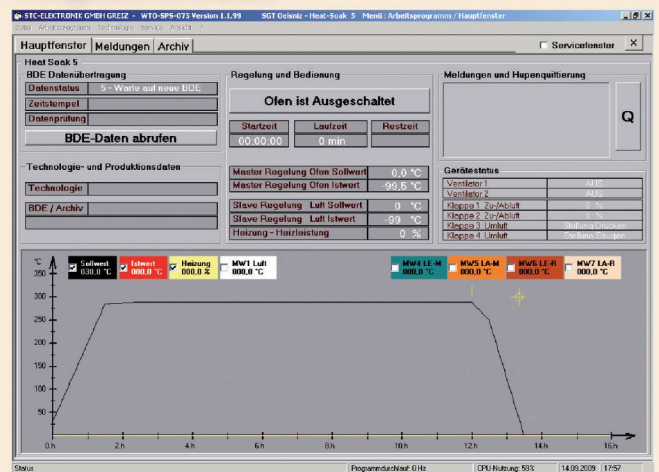

The Heat Soak Test is used for the verification of safety glass according to DIN 1249 or DIN 18516.

The single-disk safety glass, which will be checked, is exposed according to a pre-defined temperature profile in a test oven. Glass errors within the disk cause the tearing of the glass.

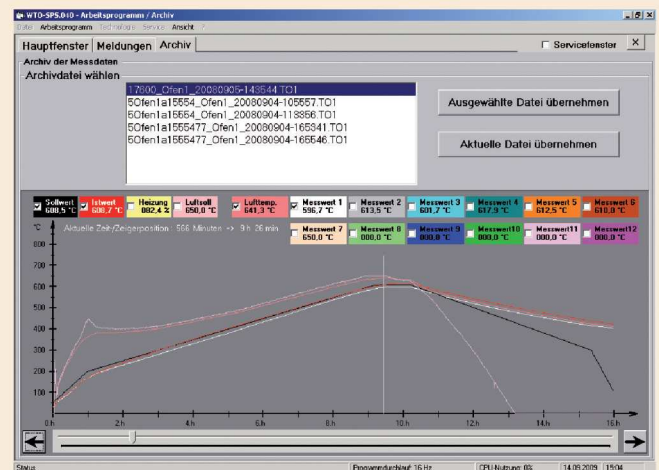

The test procedure of the glasses is archived separately, so it is possible to retrace each test step. Additionally a specific test protocol can be generated automatically. The handover of the specific order and customer data is handled automatically by a BDE-System or another data resource.

The test reports are generated completely automatically and they can be stored in redundant archives. Additionally the test reports are available as printed version on paper or pdf-file.
